

Netso

Rooftops that power cities.

Bangladesh's first rooftop solar infrastructure network.
Scaling renewable energy for a sustainable urban
future.

Tazwar Mahtab · Founder & CEO · netso.energy

Made with GAMMA

The Problem

Bangladesh sits at a critical energy inflection point. The infrastructure exists. The sunlight is free. But the systems to monetize both do not yet exist. Rising electricity demand is outpacing grid capacity, creating an urgent need for distributed renewable energy.

4,000+ MW

Untapped rooftop solar potential sitting idle across urban Bangladesh

Land Scarcity

Utility-scale solar is impossible — rooftops are the only viable path forward

\$1B+ Annual Loss

Unrealized savings from avoidable energy imports every single year

No Zero-Upfront Model

Building owners want solar but cannot afford the capital cost — no solution exists

- ❏ Rising electricity demand is outpacing grid capacity. Bangladesh faces 2,000–3,000 MW summer shortfall (2025)¹, with frequent load-shedding crippling homes and industry.¹ Bangladesh Pratidin, Feb 2025; BPDB, Jan 2026

Our Solution

Netso Platform — AI-powered rooftop solar infrastructure as a service. We operate as a RESCO (Renewable Energy Service Company), meaning we finance, own, and operate solar systems while customers pay via long-term Power Purchase Agreements (PPAs). This is fundamentally different from traditional EPC contractors who install and leave. We are building distributed energy infrastructure.

Solar Pergola System

Elevated architectural solar structures — not flat racks. Generate power and create premium usable space. The first branded rooftop solar product in Bangladesh.

Zero-Upfront Ownership

Netso finances, owns, and operates systems. Building owners earn passive monthly income. No capital required from the owner.

AI Energy Optimization

Real-time monitoring, predictive maintenance, and generation forecasting across the entire fleet.

Net Metering Integration

Excess electricity exported to the national grid via BPDB net metering — buildings earn directly from the grid.

Operator Dashboard

Fleet management for operators and investors. Live ROI tracking and generation analytics at your fingertips.

Market Opportunity

Target: Urban rooftops across Bangladesh's residential and industrial corridors. Bangladesh is at the same inflection point India was in 2015 — before rooftop solar grew 6x in 5 years (1.8 GW to 11.1 GW, 2019-2023)¹. The government has set ambitious targets, but execution is lagging. Only 245 MW deployed as of June 2025 against a 3,000 MW target — creating a massive execution gap for a scaled operator like Netso.

Rooftop Solar Potential

22M+

Urban Building Owners

3,000MW

Government Rooftop Target

📄 **Competitive landscape:** Zero scaled asset operators. Market is wide open for first-mover with proven RESCO model and industrial access.

¹ ICRA, Indian Renewable Energy Sector Report, Feb 2024

Business Model + Traction

Three revenue streams, each compounding in value over time. Our model is designed to scale from pilot to national infrastructure.

Solar Installation

Upfront margin on hardware + installation. Entry wedge into every rooftop relationship.

Asset Ownership (Core)

Netso owns systems. 25-year electricity revenue per installation. 300K BDT cost → 840K+ BDT 25-year value. 8-year payback (assumes 6% annual electricity price escalation, 2% annual maintenance costs)¹. ¹ Based on Bangladesh electricity tariff trends and RESCO model benchmarks.

Solar Leasing + PPAs

Buildings pay monthly lease below grid tariff. Recurring, infrastructure-grade cashflow.

Future Revenue

Carbon credits · Energy data platform · Virtual Power Plant grid services

Traction Today

- 01

3 kW pilot live on founder's family building — real generation data flowing
- 02

Company incorporated — Netso Energy Limited, fully registered
- 03

BPDB net metering approved (Sept 2025 guidelines) — 100% sanctioned load now allowed, single-phase consumers eligible¹. ¹ SREDA Net Metering Guidelines 2025
- 04

5+ rooftops committed in Chattogram pipeline, ready to deploy
- 05

Family garment factory network = direct industrial rooftop access

Competitive Advantage

Why Netso wins. Why it can't be copied. Five defensible advantages that compound over time.

Solar Pergola Design

Architectural, lifestyle-enhancing structures. First branded rooftop solar concept in Bangladesh. Premium positioning from Day 1.

Zero-Upfront Asset Model

Competitors are project-based contractors. Netso operates as RESCO (Renewable Energy Service Company) — proven model in India with Sunrun (\$3.2B acquisition of Vivint Solar, 2020)¹. Completely different business model that EPC firms cannot easily replicate.¹
Sunrun Inc., Oct 2020

Industrial Rooftop Access

Family garment manufacturing connections = privileged access to factory clusters. H&M, Zara, Gap actively funding renewable energy in Bangladesh RMG sector (H&M-Pran-IFC CPPA pilot, Apr 2025¹). ESG commitments: H&M carbon neutral by 2030, PUMA 35% emissions reduction by 2030. Non-replicable without factory relationships.¹
Financial Express, Apr 2025

25-Year Rooftop Lock-In

Long-term lease and PPA contracts lock rooftops. Once installed, competitors cannot displace us.

Data Moat

Proprietary generation data across Bangladesh cities. Compounds in value with every installation added to the fleet.

From 100 kW to 100 MW: A path to national energy infrastructure.

Our financial model shows how distributed rooftop solar scales into a Virtual Power Plant.

Revenue scales from \$600K in Year 1 to \$25M+ by Year 5 as industrial expansion and nationwide rollout compound returns.

Capacity Milestones

Year	Capacity	Milestone
Year 1	~100 kW	Chattogram cluster + first factory
Year 3	~10 MW	Industrial expansion
Year 5	~30 MW	Nationwide + carbon credits

Capital by Stage

At 100 MW: **\$250–400M asset portfolio.** VPP status = national energy infrastructure.

Execution roadmap: Three phases, each unlocking the next. Starting with a pilot cluster in Chattogram, expanding to industrial factories, then scaling nationally.

Tazwar Mahtab — Founder & CEO

BBA, Capilano University Canada. Born in Chattogram. Family background in garments manufacturing — direct access to factory rooftops across Bangladesh. Deep regulatory and market knowledge. Parallel builder: TransitBD, OpenClaw AI agent.

- Next Hires**
- Lead Engineer
 - Operations Lead
 - Regulatory Affairs

We are raising \$250K to execute Phase 1 and prove the model. This capital unlocks the path to Series A and national scale.

\$250,000 Pre-Seed

YC SAFE · \$2M Valuation Cap · ~11.1% equity at conversion

This capital unlocks:

Scale from 3 kW pilot to **100 kW installed cluster**

First full-time **engineering hire**

First **industrial or commercial** rooftop installation

6–12 months real generation data for Series A

Infrastructure debt facility establishment

Why Venture-Backable

We are not an installer. We are building Bangladesh's distributed rooftop energy infrastructure — the backbone of the country's clean energy transition.

"Netso taps into a \$4B+ rooftop solar market — targeting \$30M+ within 5 years through 10,000 rooftops and a distributed energy network."
